Our Projects

Jersey Biodiversity Centre has a range of projects aimed at conserving the natural environment of the island. These include programs to monitor and protect endangered species, such as the green toad and light frog, and efforts to restore important habitats, such as heathlands and wetlands. The center also engages with the community through initiatives like the Pollinator Project and Reptilewatch, which encourage nature lovers and help raise awareness about the importance of biodiversity conservation. Through these various projects, Jersey Biodiversity Centre is working towards a more sustainable future for the island, flora and fauna.

Projects

Discover our ongoing projects aimed at protecting and conserving Jersey's unique biodiversity and learn how you can get involved.

Pondwatch

Pondwatch is a citizen science project focused on conserving Jersey's native amphibians and their habitat. By spotting wildlife in your pond and submitting sightings, you can help monitor the populations of the common frog, light frog, and water toad. Two levels of involvement are available: Level 1 involves 30 minutes of observation and submission of sightings, while Level 2 requires attending training and conducting survey five times between January and May. If you don't have time for surveys, submit casual records.

[Find out More](#)

Reptilewatch

Find out about reptile sightings to help conservation in Jersey. Level 1: Spend 30 mins searching for reptiles and submit sightings. Level 2: Carry out 6 surveys for all reptiles on wall lizards. Training provided. Record casual sightings if no time for surveys. Resources available on JBBC website. Jersey has 8 native reptile species: common lizard, slow worm, wall lizard, and grass snake. Reptilewatch is a 100% or 10000 to protect these species.

[Find out More](#)

Pollinator Project

Join the Pollinator Project with a pollinating wildlife survey that takes 10 minutes. Power Insect Traps Count, BT Counts - 30 watching a patch of flowers for 10 minutes whilst recording insects that land on these flowers. Your results will help us to understand more about pollinators in Jersey and will feed into a larger UK scheme to help understand changes in numbers of pollinators. Get the app to help. Complete a 10 count in good weather between 1 April and 30 September. Resources available on the website.

Reptile Watching - Summer activity.

The Jersey Biodiversity Centre (JBC) is excited to share a fantastic free summer activity to spot wild reptiles across the Island. You need to spend 30 minutes vicissly looking for reptiles and count what species you saw and how many. There are four native reptiles you could spot and by sharing your survey you can help in their conservation.

Add a casual record

You are about to submit a record to the Jersey Biodiversity Centre without logging in. If you are interested in wildlife we would like you to consider creating an account with the Jersey Biodiversity Centre which would have advantages including easier recording options and the ability to access your records in the future. We hope you will visit us again making additional biological records.

If you would like to create a personal account before submitting your record, please follow this link: <http://jerseybiodiversitycentre.org.je/user/register>.

Personal details

First name:

Please provide your first name

Leicestershire and Rutland NatureSpotters Wanted!

Wildlife is in trouble & effective conservation relies on knowing the status of each species. You can help by logging your wildlife sightings on NatureSpot ([website](#) | [mobile app](#)). **Do I need to register?** *If you care about wildlife, record it!* We need data on all species, common or rare. All records are passed on to local & national bodies & used to further our conservation knowledge. NatureSpot only collects data for Leicestershire & Rutland. If you record elsewhere, please use [iRecord](#).

NatureSpot ID Guide to Common Thistles

Thistles are common plants and all are prickly with pink/purple flowers. The four species below are the most common species - other thistle species in our area are either rare or generally found in special habitats - such as chalky soil. They are important plants for a range of invertebrate species and some of the most attractive to bees and other nectar feeders.
Click on any header to visit the NatureSpot page for that species. Thistles are part of the daisy family - to view all species in this group visit the [NatureSpot gallery](#).

Creeping Thistle

Our most common thistle. It is a perennial and readily spreads so is often found in patches. Short to medium height.
ID: Pale pink flowers with thin, pear-shaped bases. Leaves with wavy, prickled edges. **Seen rather winged near spiky (or bare).**

Spear Thistle

An annual so usually found singularly. Grows to 1.5m. Very attractive to bees and other pollinators.
ID: Deep pink flowers on a bulbous, prickly base. **End lobe of leaf is long and 'spear' shaped.** Stem with sharp, spiny wings.

Wetland Thistle

Tall - 1.6-2m. Flowers June-August, usually in damp meadows and beside streams.
ID: Reddish-purple flowers on a bulbous base with **spiky bracts protruding.** Leaves weakly spined. Branched stem with spiny wings.

Welcome

European Butterfly Monitoring Scheme - eBMS

The data elements (entering data, viewing and downloading data) of this website will be **unavailable on Wednesday 27 September** while we move to a new server. Apologies for any inconvenience. During this period the ButterflyCount app can still be used to add records, which can be uploaded once we are back online.

Become a volunteer counting butterflies!!

Help us counting butterflies, it will increase the knowledge of butterflies and we could protect them better. There are already thousands of volunteers throughout Europe helping in butterfly conservation.

If you would like to join eBMS and collaborate in the Butterfly Monitoring Scheme you just need to register. Follow [this link](#) to the My Data section and you will find a Quick Guide for setting up butterfly monitoring.

- Join one of the biggest citizen science network
- Monitoring butterflies in your area, you will contribute to science

Lycaena phlaeas

Enter results from your FIT Count

The 2023 PoMS recording season started on 1 April and runs until 30 September. Thanks to everyone who is taking part this year.

Please add the results from your [FIT Count](#) for any date between 1 April and 30 September 2022 See all the counts for the current season on the [FIT Counts map](#).

(If you are taking part in the 1 km square surveys and have FIT Count data to enter from your square please use the [1 km square FIT Count form](#))

If you are entering several counts you can use the green padlock symbols to 'lock' many of the boxes, so that you only need to enter your choice once - the setting will be remembered when you add your next count

Your name:  

Please add the recorder's name, if it is not already shown, using the format "First name Surname"

Date of FIT Count:

Could you make use of Targeting Revisits Maps?

Designed to help wildlife recorders make the most of their time out recording insects, Targeting Revisits Maps are available to guide people to where records of the following species are most needed:

- Craneflies
- Grasshoppers and bushcrickets
- Ground beetles
- Ladybirds
- Soldierflies

Hopefully these will inspire you to go out and record in new places or to record groups you haven't recorded before.

Find out more [here](#) and please give feedback [here](#).

Verification

- Is the record acceptable for the recording scheme?
- Is there a photo that shows the species has been correctly identified?
- In the absence of a photo:
 - is the location and date likely?
 - is the record from a regular recorder or are they new to recording?
- Verifiers can query records and ask the recorder for more information.
- Not all records provide enough evidence to accept.
- The number of records that can be accepted either immediately or following some queries is actually a very high proportion.

Ongoing Development

- JNCC and UKCEH have agreed a 5-year programme to support the work of BRC, including Indicia support and development.

UK Centre for
Ecology & Hydrology

- Continue to increase capacity of servers and databases to ensure performance keeps up with demand.
- Support schemes that want to move their data into Indicia.
- Review feedback from verifier survey.
- Continue to work on data quality and filtering.
- Updates and enhancements to record cleaner tool.

RESEARCH ARTICLE

A repeatable scoring system for assessing Smartphone applications ability to identify herbaceous plants

Neil Campbell¹, Julie Peacock², Karen L. Bacon^{1*}

* karen.bacon@nuigalway.ie

Abstract

The ubiquity of Smartphone applications that aim to identify organisms, including plants, make them potentially useful for increasing people's engagement with the natural world. However, how well such applications actually identify plants has not been compressively investigated nor has an easily repeatable scoring system to compare across plant groups been developed. This study investigated the ability of six common Smartphone applications (Google Lens, iNaturalist, Leaf Snap, Plant Net, Plant Snap, Seek) to identify herbaceous plants and developed a repeatable scoring system to assess their success. Thirty-eight species of plant were photographed in their natural habitats using a standard Smartphone (Samsung Galaxy A50) and assessed in each app without image enhancement. All apps showed considerable variation across plant species and were better able to identify flowers than leaves. Plant Net and Leaf Snap outperformed the other apps. Even the higher performing apps did not have an accuracy above ~88% and lower scoring apps were considerably below this. Smartphone apps present a clear opportunity to encourage people to engage more with plants. Their accuracy can be good, but should not be considered excellent or assumed to be correct, particularly if the species in question may be toxic or otherwise problematic.

- JNCC and UKCEH have agreed a 5-year programme to support the work of BRC, including Indicia support and development.

- Data visualization
 - Help local records centres and recording schemes to visualize data.
 - Provide feedback to recorders showing how their records contribute to the bigger picture.
 - Maps and phenology charts added to iRecord.
 - Data visualisations added to the UK Pollinator Monitoring Scheme Website.

Insect groups visiting PoMS target flowers

Submitted by admin on Tue, 07/06/2021 - 10:02

The charts below allow you to explore how frequently different insect groups visit the PoMS target flowers, based on the data collected during the Flower-Insect Timed Counts (FIT Counts). The figures get updated 'live' as more counts are added via our website and app.

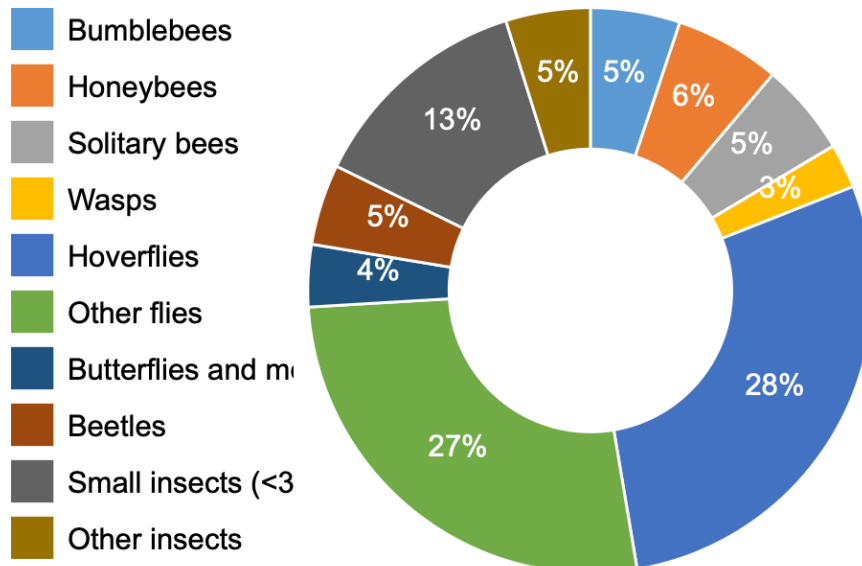

Choose the flower that you wish to explore from the dropdown list, and then hover over or click on the chart to highlight the insect groups.

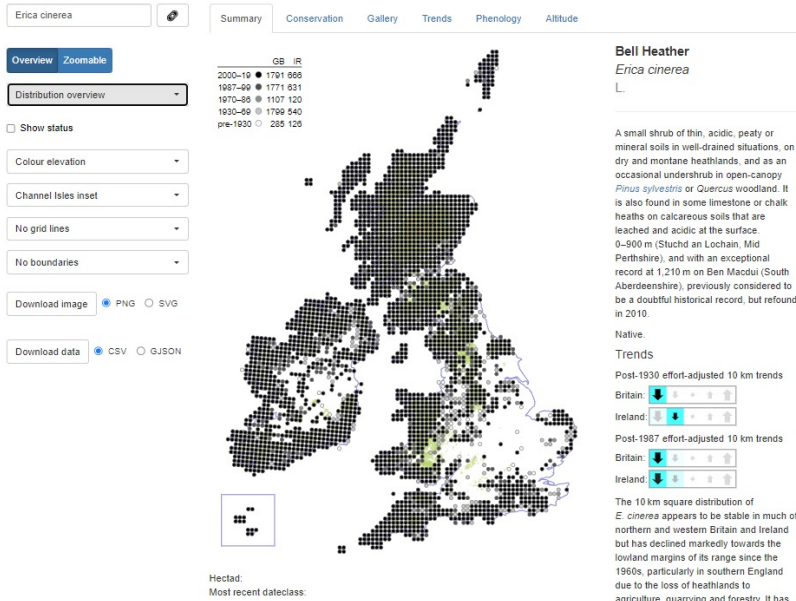

The charts are based on data from all FIT Counts submitted from the UK and Isle of Man, between 1 April and 30 September each year since PoMS started collecting data in 2017.

PoMS data is subject to review, and totals shown here may differ from our published datasets and reports.

Ragwort

Insects counted on **Ragwort** showing the proportion from each group. A total of **12962 insects** have been counted during **1003 FIT Counts** - an average of **13 insects per 10-minute count**.

Bell Heather *Erica cinerea* L.

A small shrub of thin, acidic, peaty or mineral soils in well-drained situations, on dry and montane heathlands, and as an occasional undershrub in open-canopy *Pinus sylvestris* or *Quercus* woodland. It is also found in some limestone or chalk heaths on calcareous soils that are leached and acidic at the surface. 0-900 m (Stuchd an Lochain, Mid Perthshire), and with an exceptional record at 1,210 m on Ben Macdui (South Aberdeenshire), previously considered to be a doubtful historical record, but refuted in 2010.

Native:
Trends

Post-1930 effort-adjusted 10 km trends

Britain:

Ireland:

Post-1987 effort-adjusted 10 km trends

Britain:

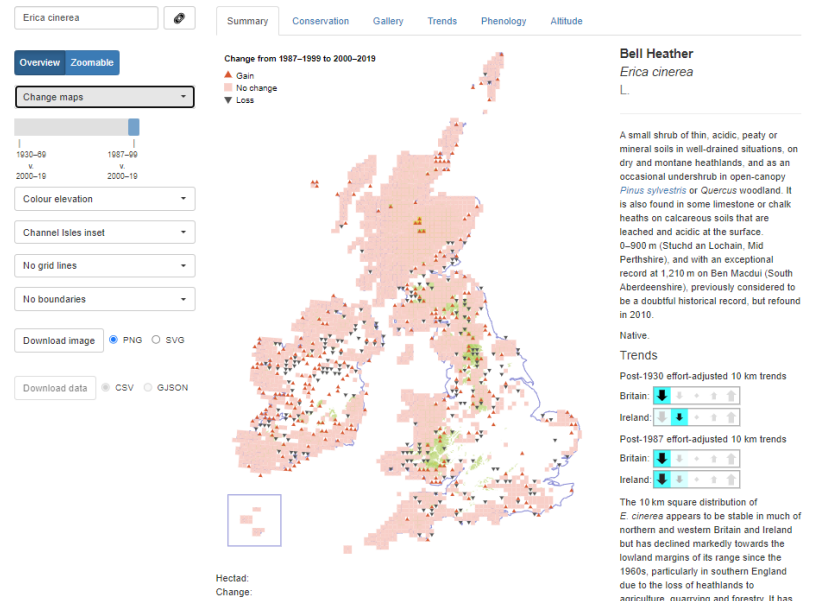

Ireland:

The 10 km square distribution of *E. cinerea* appears to be stable in much of northern and western Britain and Ireland but has declined markedly towards the lowland margins of its range since the 1950s, particularly in southern England due to the loss of heathlands to agriculture, quarrying and forestry. It has also disappeared from many former limestone and chalk heath sites through encroachment of rank grass and scrub following reduction in sheep and rabbit grazing.

Biogeography

Oceanic Temperate element.

Targeting Revisits Maps to help get the most out of insect recording

To help wildlife recorders make the most of their time out recording insects, we've created the Targeting Revisits Maps to guide people to where records of some of these species are most needed.

A Targeting Revisits Map shows the pattern of recording in 1km grid squares and highlights squares that are 'well recorded' (with records from more than one year) and squares that are 'targets for revisits' (with records from only one year in the past). Can you visit squares and make records, and so turn the pink squares green?

We have Targeting Revisits Map for:

- [Grasshoppers and bushcrickets](#)
- [Craneflies](#)
- [Ground beetles](#)

Potential future developments

- Data explorers and data visualisation

Classification Probability

Species for These plots show histograms of classification probability for each recording (in 5% intervals), the higher the probability, the more certain the classifier is that a species was present in an individual recording.

Include detector deployment summary

What this means for local experts

- Data access – easier to access and view records within the Bailiwicks
- Data uploading – gradual move to standardised Indicia forms (hopefully!) means this should be relatively painless and help can be given!
- Verifying data – local experts willing to verify data in CI greatly appreciated, particularly for general recording apps (e.g. iRecord)
 - Willing verifiers can email irecord@ceh.ac.uk, explain a bit about your expertise, and if approved by the UK recording scheme (e.g. Butterfly Conservation), you're all set to verify!
 - Without verification, records can't pass to NBN or GBIF

Thanks to:

- All contributing funders.
- All contributing recorders.
- The national and local recording schemes/groups and their verifiers.

Thank You for Listening
